

NOTE: "Natural color and odor variations may occur in this product," as stated on the label.

Scent variance is a natural tendency for amino acids and may become pronounced in the warm months. If a bottle does get warm during transport and emits a stronger than usual scent, the efficacy and condition of the product is still perfectly viable. A quick remedy is simply to refrigerate the product.

If you do opt to refrigerate, the lid must remain on, as moisture, not heat, may damage the product.
